Tasks for Assignment 2

I discuss my idea and steps before the codes

Help company set to price their new apartments (small and mid-size apartments hosting 2-6 quests) not on the market in Berlin

```
In [9]:
         import re
          import pandas as pd
          import numpy as np
          from plotnine import *
          from mizani.formatters import percent_format
          from sklearn.linear_model import LinearRegression, Lasso
          from sklearn.tree import DecisionTreeRegressor

          from sklearn.model_selection import cross_val_score
          from sklearn.preprocessing import StandardScaler
          import matplotlib.pyplot as plt
          from py_helper_functions import *
          import warnings
          warnings.filterwarnings("ignore")
```

Data Prepare

```
In [10]: data = pd. read_csv('listings.csv')
```

We need a small and middle apartment, 2-6persons according to assignment

```
In [11]: data=data.loc[(data.accommodates < 7) & (data.accommodates > 1)]
```

We need deal with missing values:

For those not miss too many: use mean to replace it For those miss not too many: drop the colloums

```
In [12]: # show the columns of missing value na_filter=data.isna().sum()
```

```
na_filter[na_filter > 0].index

Mean CV RMSE of Four Models

With the help of the two graphs, we can easily judge GBM and lowest RMSE, which has the best predication result and is the best model. OLS and LASSO results are alomost the same, which seem not so bad. CART is the worst reuslt and has much higher RMSE than the other three.
